

NETWORKING :

Good job!

Correct! The App Engine Flexible environment is hosted in a Google-managed VPC, and so should use Private Service Access for implementing Private Access.

Question 1:

You want to establish secure connection between your App Engine Flexible environment and a VM containing a database.

What type of Private Access should you use?

Private Service Connect

Private Service Access

Private Google Access

Good job!

Correct! You can connect VPCs from different projects using VPC Network Peering.

Question 2:

You have a VM hosted in VPC1 in project1 that you want to securely connect to another VM hosted in VPC2 in project2.

How can you do that?

Using the VMs' public IPs.

Private Google Access

VPC Network Peering

Good job!

Correct. By default, a VPC named default is created, with subnets in every region.

Question 3:

True or false: By default, when creating a new project, and VPC named `project1` is created with a single subnet.

True

False
